Touch Screen Controller

Version V01

September, 2014

1. General Description

HX8526-E30ADCG is a capacitive touch screen control IC designed for I²C interface that supports touch screen of 30 sensing channels I/O. HX8526-E30ADCG also provide flexibility and selective functionality solution for the variety application of touch screen.

HX8526-E30ADCG supports the flash memory to store calibration data and application parameters. HX8526-E30ADCG is suitable for any capacitive touch screen application combined with high performance controller and friendly user interfaces, and wide operating temperature range.

2. Features

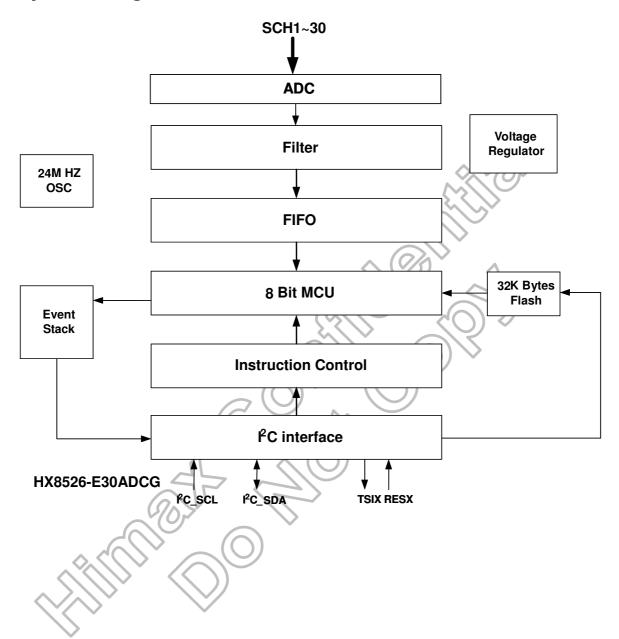

- Projective touch screen control IC
- Programmable scan line
- Support 30 channels I/O
- Both self capacitance and mutual capacitance technology adopted
 - HX8526-E30ADCG for multi touch (All points)
- Low power consumption
- Auto noise filter function
- Support I²C interface
- Customer function design (Embedded with RDC8051)
 - 256 byte scratchpad RAM interface
 - 12K byte external RAM
 - 32K flash program memory address space
- 2.7V to 3.6V operating voltage
 - VCCA(Analog power)=2.7V to 3.6V.
 - VCCD(Digital power)=1.65V to 3.6V.
- Temperature range: -40 ~ +85 °C
- Flash memory to store calibration data and application parameters

10. Electrical Specifications

10.1 DC characteristics

(VCCD=1.65 ~ 3.6V, VCCA=2.7 ~ 3.6V, T_A=-40 ~ 85 °C)

Parameter	Symbol	Condition		Spec.		Unit
Faranietei	Symbol	Condition	Min.	Тур.	Max.	
Input high voltage	V_{IH}	VCCD=1.65 ~ 3.6V	0.7VCCD	-	VCCD	٧
Input low voltage	V_{IL}	VCCA=2.7 ~ 3.6V	0	-	0.3VCCD	V
Output low voltage (SDO)	V_{OL1}	VCCD=1.65 ~ 3.6V I _{OL} =1.0mA	0	(0)	0.2VCCD	٧
Current consumption deep-standby mode (VCCA/VCCD-VSS)	I _{ST(VDD)}	VCCA=3.3V, VCCD=3.3V, T _A =25°C	- 2	20	-	μΑ
Current consumption active mode (VCCA/VCCD-VSS)	I _{ACTIVE(VDD)}	VCCA=3.3V, VCCD=3.3V, T _A =25°C		Note ⁽¹⁾	-	mA
Current consumption idle mode (VCCA/VCCD-VSS)	I _{ACTIVE(VDD)}	VCCA=3.3V, VCCD=3.3V, T _A =25°C	9)	Note ⁽²⁾	-	mA
Minimum slew rate of VCCA and VCCD	-		1		-	V/ms
Ripple voltage of VCCD and VCCA	V _R	VCCA=3.3V, VCCD=3.3V, T _A =25°C		-	100	mV

Note 1: Depend on report rate setting, the range is $7 \sim 10 \text{mA}$. Note 2: Depend on report rate setting, the range is $0.6 \sim 0.9 \text{mA}$.

10.2 AC characteristics of the SDA and SCL bus lines for I²C-bus devices

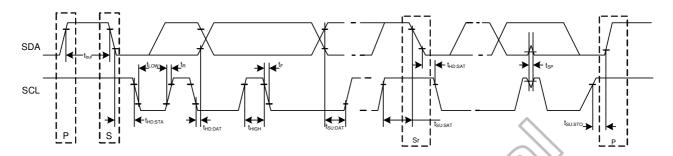

Figure 10.1: I²C timing

Parameter	Symbol	_	rd-mode bus	Fast-mo		Unit
		Min.	Max.	Min.	Max.	
SCL clock frequency	f_{SCL}	0	100	0	400	KHz
Bus free time between STOP and START condition	t _{BUF}	4.7	-(6	1,3	-	μs
Hold time (repeated) START condition. After this period, the first clock pulse is generated	t _{HD:STA}	4.0	\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\	0.6	-	μs
Low period of the SCL clock	t_{LOW}	4.7	\bigcirc	1.3	-	μs
High period of the SCL clock	$t_{\sf HIGH}$	4.0	-	0.6	-	μs
Setup time for a repeated START condition	t _{su:sta}	4.7	-	0.6	-	μs
Data hold time	$t_{HD:DAT}$	> 0	-	0	0.9	μs
Data setup time	$t_{\scriptscriptstyle SU:DAT}$	250	-	100	-	ns
Rise time of both SDA and SCL signals	t_R	-	1000	20+0.1 C _b	300	ns
Fall time of both SDA and SCL signals	$t_{\scriptscriptstyle F}$	-	300	20+0.1 C _b	300	ns
Setup time for STOP condition	$t_{\scriptscriptstyle SU:STO}$	4.0	-	0.6	-	μs
Capacitive load for each bus line.	C_b	-	400	-	400	pF

Note: (1) All values are referred to VIH (0.7VCCD) and VIL (0.3VCCD) level.

- (3) The maximum $t_{HD:DAT}$ has only to be met if the device does not stretch the low period (t_{LOW}) of the SCL signal.
- (4) A fast-mode I²C-bus device can be used in a standard-mode I²C-bus system, but the requirement $t_{SU:DAT} \ge 250$ ns must then be met. This will automatically be the case if the device does not stretch the low period of the SCL signal. If such a device does stretch the low period of the SCL signal, it must output the next data bit to the SDA line $t_{R\,max} + t_{SU:DAT} = 1000 + 250 = 1250$ ns (according to the standard-mode I²C-bus specification) before the SCL line is released.
- (5) C_b = total capacitance of one bus line in pF.
- (6) If a spark or noise appear on SDA line and keep more than 25ns, START or STOP condition will be identified if SCL line keep high at this time.

Himax Confidential -P.12-

⁽²⁾ A device must internally provide a hold time of at least 300ns for the SDA signal (referred to the VIH of the SCL signal) in order to bridge the undefined region of the falling edge of SCL.

11. Interface

11.1 System interface

The HX8526-E30ADCG supports I²C interface (NXP(x-Philips) serial interface).

11.2 Transfer protocol (I²C interface)

HX8526-E30ADCG support I²C interface that need 2 hardware pin – serial data (**SDA**) and serial clock (**SCL**), carry information between the devices connected to the bus. The I²C bus supports serial, 8-bit oriented, bi-directional data transferred at a rate up to 100Kbit/s in the standard-mode, or up to 400Kbit/s in the fast-mode.

The data on the SDA line must be stable during the high period of the clock. The high or low state of the data line can only change when the clock signal on the SCL line is low.

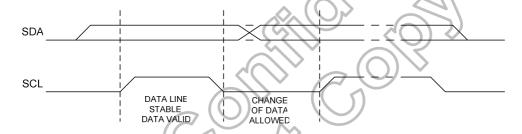

Figure 11.1: I²C signal timing

Within the procedure of the I²C-bus, unique situations arise which are defined as START and STOP conditions. A high to low transition on the SDA line while SCL is high is one such unique case. This situation indicates a START condition. A low to high transition on the SDA line while SCL is high defines a STOP condition. START and STOP conditions are always generated by the master. The I²C bus is considered to be busy after the START condition. The I²C bus is considered to be free again a certain time after the STOP condition.

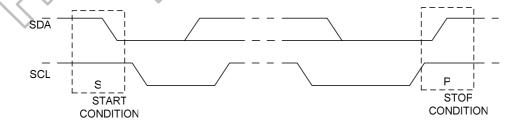

Figure 11.2: I²C START/STOP

Himax Confidential

-P.13This information contained herein is the exclusive property of Himax and shall not be distributed, reproduced, or disclosed.

The HX8526-E30ADCG only supports I²C interface and the slave address is 90/94h. In I²C slave mode, HX8526-E30ADCG waits for Master reading the data and acknowledges. Every byte put on the SDA line must be 8-bits long. The number of bytes that can be transmitted per transfer is unrestricted. Each byte has to be followed by an acknowledge bit. Data is transferred with the most significant bit (MSB) first.

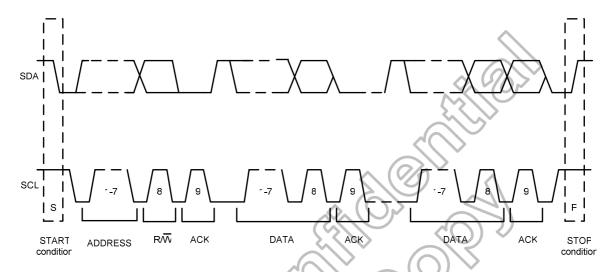

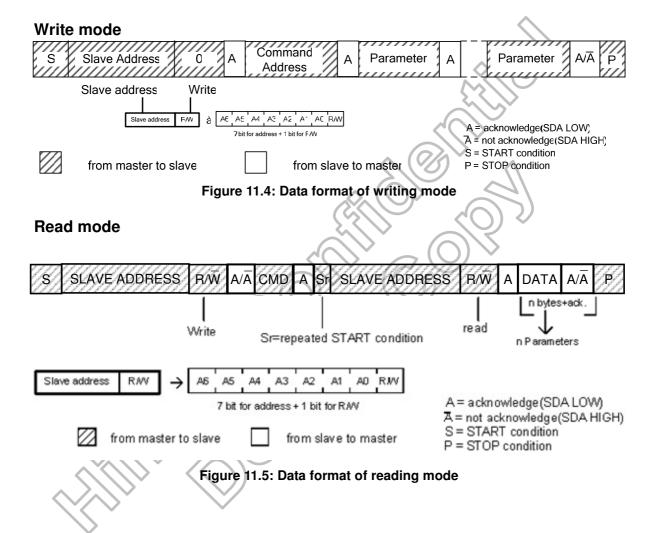

Figure 11.3: I²C data transfer

11.2.1 Format of data frame (I²C interface)

When master sends the command which be received by HX8526-E30ADCG, the HX8526-E30ADCG will responses the code and data. The format of communication is shown as Figure 11.4. The Command table that is written by master is defined on Table11.1 Command Table. HX8526-E30ADCG wills response the response code first and data later.
